

#	Story Name	User Story / Journey	Acceptance Criteria
1	Docker Infrastructure	As a developer or SRE, I want a containerized multi-tier architecture so that I can ensure the Frontend, Middleware, and Database are isolated and reproducible.	- docker-compose.yml defines frontend, middleware, and database.- Services joined to a custom bridge network.- Health checks ensure Middleware starts after Database.
2	Register Artist Page	As a data administrator, I want a dedicated page with a form to input all required artist details so I can create new records in the system.	- Form Fields: Artist Name (req), Genre, City, Country.- Client-side validation shows error if Name is empty.- POST /artist/register endpoint creates record.
3	Change of APIs to Match Location	As a Middleware developer, when the data source moves, I want to update configuration to point to the new API location to avoid service interruption.	- Config variables (env files) updated to new location.- Connectivity test passes for new endpoint.- No regressions in existing data retrieval.
4	Data Schema Overhaul	As a data architect, I want the core database schema updated to support new data types (detailed location, discography format) to ensure scalability.	- Schema definition exists for new fields.- Database migration successful (Flyway/Liquibase).- All existing records successfully mapped to new schema.
5	Location Info Integration	As the primary artist data consumer, I want to receive accurate and comprehensive location data (City and Country) to fulfill geographic search requests.	- Middleware retrieves and exposes "city" and "country" fields.- The User Interface is updated to display location on profiles.
6	Comprehensive Middleware Testing	As a QA/Dev, I want to ensure the API handles all edge cases and error scenarios to maintain high availability and data integrity.	- 100% pass rate for unit tests on data mapping.- Integration tests confirm database connectivity under load.- Error codes (404, 500) return correct JSON formats.
7	Create Containerization Files	As a DevOps engineer, I want optimized Dockerfiles for each service so that cloud hosting deployments are efficient and secure.	- Dockerfiles use multi-stage builds.- Non-root users used in containers for security.- Image sizes minimized by removing dev-dependencies.
8	Improve Accessibility/Responsiveness	As a user with diverse needs, I want a responsive and accessible frontend so I can use the application on any device.	- 100% WCAG AA compliance for color contrast.- Mobile-friendly navigation menu.- Screen reader support for all form inputs.
9	Configure MiddleWare Hosting	As a system admin, I want the Middleware hosted on a scalable cloud platform so it can handle variable user traffic.	- Environment is provisioned in the cloud provider.- SSL/TLS certificates configured for secure communication.- Auto-scaling rules defined for CPU/Memory.
10	Configure FrontEnd Hosting	As a system admin, I want the React application hosted via a CDN so users experience fast load times globally.	- Frontend assets uploaded to S3/CDN.- Cache invalidation scripts set up for deployments.- Custom domain mapped to the CDN endpoint.
11	Artist List Page	As a user, I want to see a paginated list of all artists so that I can browse talent without feeling overwhelmed.	- Pagination controls (Next/Prev) are functional.- List displays Name, Genre, and a thumbnail image.- Sorting by "Recently Added" is available.
12	3rd Party API Discovery	As a developer, I want to research and document available music APIs (Spotify/Last.fm) to enrich our artist data.	- Documentation of 3 API options with pricing/limits.- Selection criteria met for "Discography" data.- POC code snippet for fetching data from one API.
13	Display Artist Discography	As a fan, I want to see an artist's discography on their profile page so I can learn about their musical history.	- Discography section added to Artist profile.- Albums display Title, Year, and Cover Art.- Data is fetched from the Middleware endpoint.
14	Location Search Data Retrieval	As a user, I want search results to be refined by city or country so that I can find local talent.	- Search API supports query parameters for location.- DB query optimized for geographic indexing.- Results accurately reflect the requested location.
15	Introduce Artist Discography Data	As a data engineer, I want to populate the database with album and track info to support the discography feature.	- Discography table added to the database.- One-to-many relationship established with Artist table.- Data ingestion script imports album data for existing artists.
16	Configure Data Storage	As a system architect, I want a managed database instance (e.g. RDS) so that data is backed up and highly available.	- Managed DB instance provisioned.- Daily backup policy enabled.- Security groups configured to only allow access from Middleware.
17	Artist Information Page	As a user, I want to click an artist and see a detailed biography and stats so I can decide if I want to book/follow them.	- Navigation to /artist/:id works.- Bio, Stats, and Social Media links are displayed.- "Back to Search" button returns user to their previous state.
18	3rd Party API Ingestion	As a developer, I want to sync our database with 3rd party APIs daily so that our data remains up to date.	- Cron job/Task runner executes every 24 hours.- API rate limits are respected (throttling implemented).- Logs report the number of updated records.
19	Genre / Search Web page	As a user, I want a dedicated search page where I can filter by genre so I can find specific types of music.	- Genre dropdown/tags allow for multiple selections.- Search results update in real-time as filters change.- "No results found" state is handled gracefully.
20	Location Search - Web page	As a user, I want a map or location input on the search page so I can find artists near me.	- Map integration or location autocomplete input.- Search results update based on the map radius or city.- Geographic coordinates are passed correctly to the API.
21	User Landing Page	As a first-time visitor, I want a clear landing page so I understand the application's purpose and how to start.	- Value proposition displayed prominently.- "Get Started" button leads to the Search page.- Images and branding are consistent with the style guide.
