Team Members

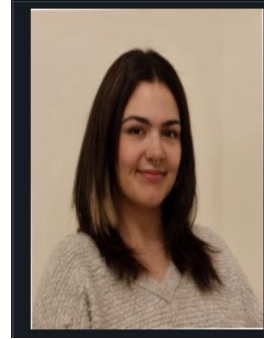

Emmet Allen- Scrum Master /
Systems Architect

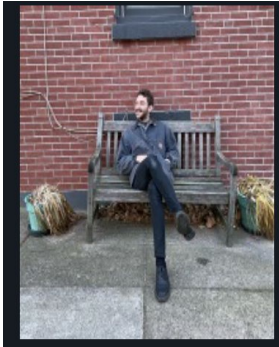

Ben Smith - Backend Dev /
Integrations

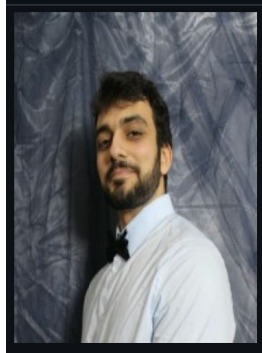

Brian Moran - Full Stack Dev

Front End Dev Lead

Pete Adams - Back End Lead / Data Team

Christos Markakis - Data Team / Full Stack Dev

Jalen Gill - Front End Dev / Integrations

Improvements from Feedback

- Reviewed peer and instructor feedback on project presentation and group wiki page.
- Added download links for sprint deliverable items
- Incorporated content into the wiki page to meet syllabus standard.
- Added slides with relevant metrics on development process and status (burndown, velocity)
- Adjusted agenda slides to reflect presentation order
- Updated user stories to include better titles for who desires the functional request

Project Description

Curated By You, For You (CFYBY)

Curated By You, For You is a location-based music discovery platform designed to solve the challenge of fragmented and inconsistent local artist information. It provides users with a reliable way to discover, understand, and engage with artists in their local music scenes.

Who It's For

Musicians looking to increase visibility, music fans seeking meaningful local discoveries, and industry professionals monitoring regional talent and trends.

What It Does

CFYBY collects and organizes artist data by **city, country, and genre**, delivering structured artist profiles, location-based search results, and discography insights. The application uses a secure backend and middleware layer to ensure accurate data delivery, graceful error handling, and consistent performance across devices.

Benefit Outcomes

By improving data quality, accessibility, and transparency, CFYBY makes local music discovery easier for fans, helps artists grow sustainable audiences, and supports healthier, more connected local music ecosystems.

Team Working Agreement

- **Team Syncs:** The team meets **twice weekly on Tuesdays at 6:00 PM and Thursdays at 6:00 PM EST** to align on progress, barriers, and next steps. Additional meetings may be scheduled as needed.
- **Pair Programming:** Development work is completed in **pairs** to encourage collaboration, shared understanding, and consistent quality.
- **Ownership & Accountability:** If one partner is unavailable, the remaining partner is expected to **continue progress**, document updates, and flag risks early.
- **Pair Flexibility:** Pairings may **rotate per story or per sprint** based on availability, workload, or required expertise to ensure balanced contribution.
- **Story Readiness:** All stories must be **groomed, clearly defined, and estimated** before entering a sprint.
- **Story Kickoff:** Each story requires a **brief kickoff discussion** (including 1–2 additional team members when appropriate) to confirm scope, acceptance criteria, and dependencies.
- **Communication Standards:** All updates, blockers, and decisions should be **communicated promptly** through the agreed team channels.
- **Quality Expectations:** Code must meet agreed standards, include basic testing where applicable, and be **reviewed before completion**.
- **Respect & Collaboration:** Team members are expected to communicate respectfully, support one another, and maintain a solution-oriented mindset.

Primary User : DJ Two Tone

- Age, 23
Gender : Male
Location : New York
Occupation: DJ
- DJ Two Tone is a local DJ who performs at clubs and parties. While he often mixes popular, well-known tracks into his sets, he's now looking to incorporate more local cultural music genres to create unique experiences that celebrate the community and connect audiences with the sounds of their own scene.
- **Issue:** Difficulty accessing and integrating unfamiliar cultural music genres—such as Jakarta folk—into performance sets, requiring extensive independent research through scattered sources like record stores, forums, and music databases.
- **Solution:** The platform enables DJs and creators to easily discover and explore local and niche genres by searching specific locations and styles (e.g., Jakarta + Folk Music), instantly connecting them with relevant artists, bands, and tracks to blend seamlessly with their own sets.

Primary User 2 : Tobi

- Age, 29
Gender: Male
Location : West Nyack, NY
Occupation: Musician
- Tobi is a musician looking for his big break into the music industry. He plans on starting in the local scene to build his experience and connections in the industry.
- **Issue:** Music creators face barriers in networking, collaboration, and expanding their creative expertise, limiting growth and visibility.
- **Solution:** Our platform empowers creators by fostering meaningful connections, driving community-driven promotion, and offering tools and resources to continuously expand their skill set.

Primary User 3: Glenn

- Age, 58
Gender : Male
Location : Chattanooga, TN
Occupation: Store Manager
- Glenn is a store manager that often listens to music in his spare time. He uses apps like Spotify and Apple Music to listen to his preferred music and popular music of today. He wants to immerse himself in new music by discovering new artists locally.
- **Issue:** As a music fan, it can be hard to discover new local performers beyond the big-name acts. Relying on word of mouth or chance encounters often means missing out on fresh talent, especially younger or emerging artists who aren't promoted widely.
- **Solution:** The platform makes it easy for fans to discover new and local artists tailored to their tastes. By combining personal preferences with location-based recommendations, fans can explore performers they might not otherwise find—helping them connect with fresh music while supporting their local scene.

MVP Feature Prioritization

- **Feature Name:** Location and Genre Based Search
 - Purpose: Searching Capabilities for Music Artist
 - User story: As a User, I want to search for artists using a specific location and music genre, so that when I complete the search, I'm provided with a list of artists who are from that location and perform that genre.
- **Feature Name:** Artist Music Listing
 - Purpose: Provide Artist Music Collection
 - User story: As a User, when I search an artist using the application, I want to be able to click on an artist, so that I can see their discography

Algorithms:

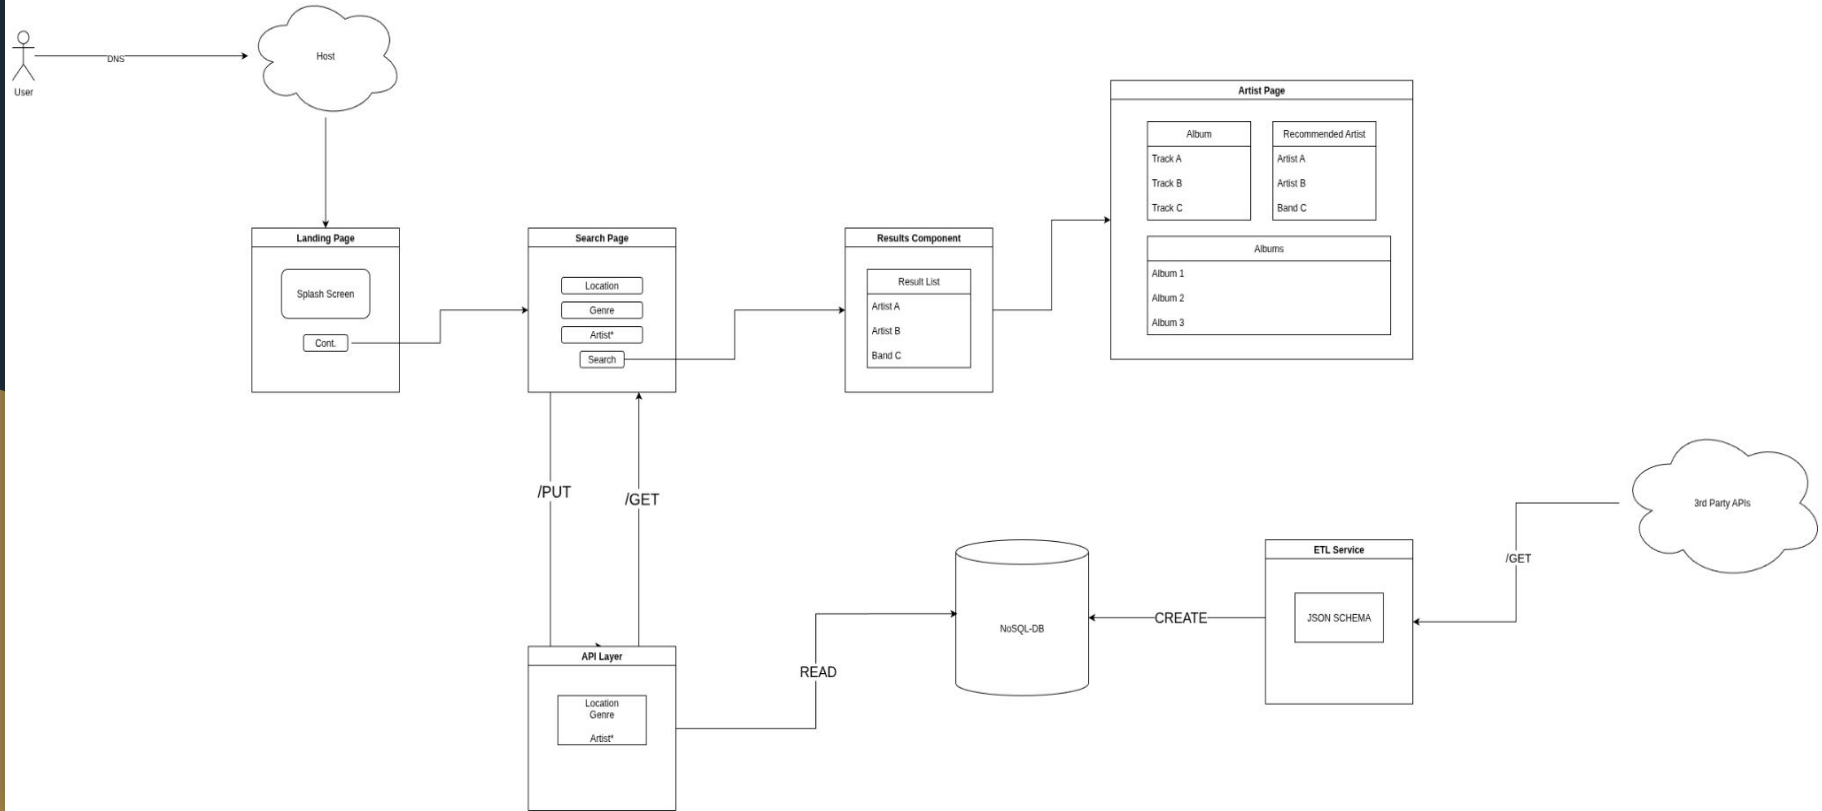

Entity Resolution / Deduplication: cleaning and removing dupes from our corpus of data

Hybrid Ranking (RRF): merging tables of similar genres on location proximity and popularity

Inverted Index: classic search engine implementation, used to search for band name, genre, location, and/or description

Haversine Distance: used to calculate the distance between a user and the known location of an artist to give them locally tailored results

Architecture Diagram

Backend REST API

The heart of the backend is a REST API that's queryable through HTTP GET requests. Data is accessed from our local repository of artists and then transformed into a JSON payload.

We've expanded the dataset and endpoints considerably since Sprint 1.

*/artists/genre
/artists/location
/ - (root that returns the current API spec and version)
/local/audio
/artists
/artists/{name}
/artists/{name}/description
/artists/{name}/image
/artists/{name}/albums
/album/{title}/description*

*POST /artists/register
POST /artists/register/discography*

API Request Example

Curl

```
curl -X 'GET' \
'http://localhost:8001/artists/genre?genre=metal&n=5' \
-H 'accept: application/json'
```

Request URL

<http://localhost:8001/artists/genre?genre=metal&n=5>

    "_id": "6942fe84a7e1e6d453ecbd44",
    "name": "Children of Bodom",
    "location": "Espoo, Finland",
    "summary": "Children of Bodom was a Finnish melodic death metal band from Espoo. Formed in 1993, the group currently consists of Alexi Laiho (vocals, lead guitar), Roope Latvala (rhythm guitar), Janne Wirman (keyboards), Henkka Seppälä (bass), and Jaska Raatikainen (drums). In total they have released seven studio albums, two live albums, two EPs, two compilation albums and one DVD.\n\nThe band's third studio album, Follow the Reaper, was their first album to receive a Gold certification in Finland, and since then, all seven of the band's studio albums have reached the same status. In Finland, Children of Bodom has released three consecutive albums that debuted at number one on Finnish album charts, and has also seen chart positions on the United States Billboard 200.\n\nThe band has incorporated many different musical styles, leading critics and fans to label them as melodic death metal, power metal, thrash metal, and early symphonic black metal and neoclassical metal. They are one of Finland's best selling artists of all time with more than 250,000 records sold there alone.",

Artist Page

After clicking an artist, the user is taken to a details page that shows more information about the artist.

The screenshot shows a dark-themed music application interface for Bruce Springsteen's artist page. At the top, there's a navigation bar with 'Home' and 'Search' links. Below this, the artist's name 'Bruce Springsteen' is prominently displayed. The main content area is divided into several sections: 'Albums' on the left, 'About' on the right, and 'Recommended Artists Based On Bruce Springsteen' at the bottom right. The 'Albums' section lists four albums: 'Human Touch' (14 tracks), 'The Promise' (10 tracks), 'Nebraska' (10 tracks), and 'Born to Run' (8 tracks). Below these, a track listing for 'Born to Run' is shown with a table of 6 tracks and their durations. The 'About' section provides a brief biography of Bruce Springsteen, mentioning his birth date (September 23, 1949) and his work with the E Street Band. The 'Recommended Artists' section lists five artists: Foo Fighters, Keane, Coldplay, Alanis Morissette, and Linkin Park, each with their location and a link to their results page.

Artist Registration Page

This page allows you to enter an artist's information and discography to register them to our website.

The screenshot displays a web browser window with a blue background. A white registration form is centered on the page. At the top of the form, there are navigation links: "Home", "Search", and "Register". The form is titled "Artist Registration". It contains several input fields for artist information: "Artist Name", "City", "State", "Country", and "Genre". Below these fields is a section titled "Album #1" which includes input fields for "Album Title", "Year Released", and "Image Link". At the bottom of the form, there is a "Track 1" input field and a "Min:Sec" field with a "0:00" value. In the bottom left corner of the browser window, a black status bar shows the URL "localhost:8080/register".

Sprint 2 Backlog

These were the stories completed in Sprint 2. Each story is estimated using story points, which are reflected in the number column.

- Story points are a measurement used within Agile to describe the complexity of a given task
- For example, a task can be given either a fibonacci number (1,2,3,5) or T-shirt sizes (S,M,L,XL)
- It's used to ensure that the team members know what the task may entail before taking up the story or feature

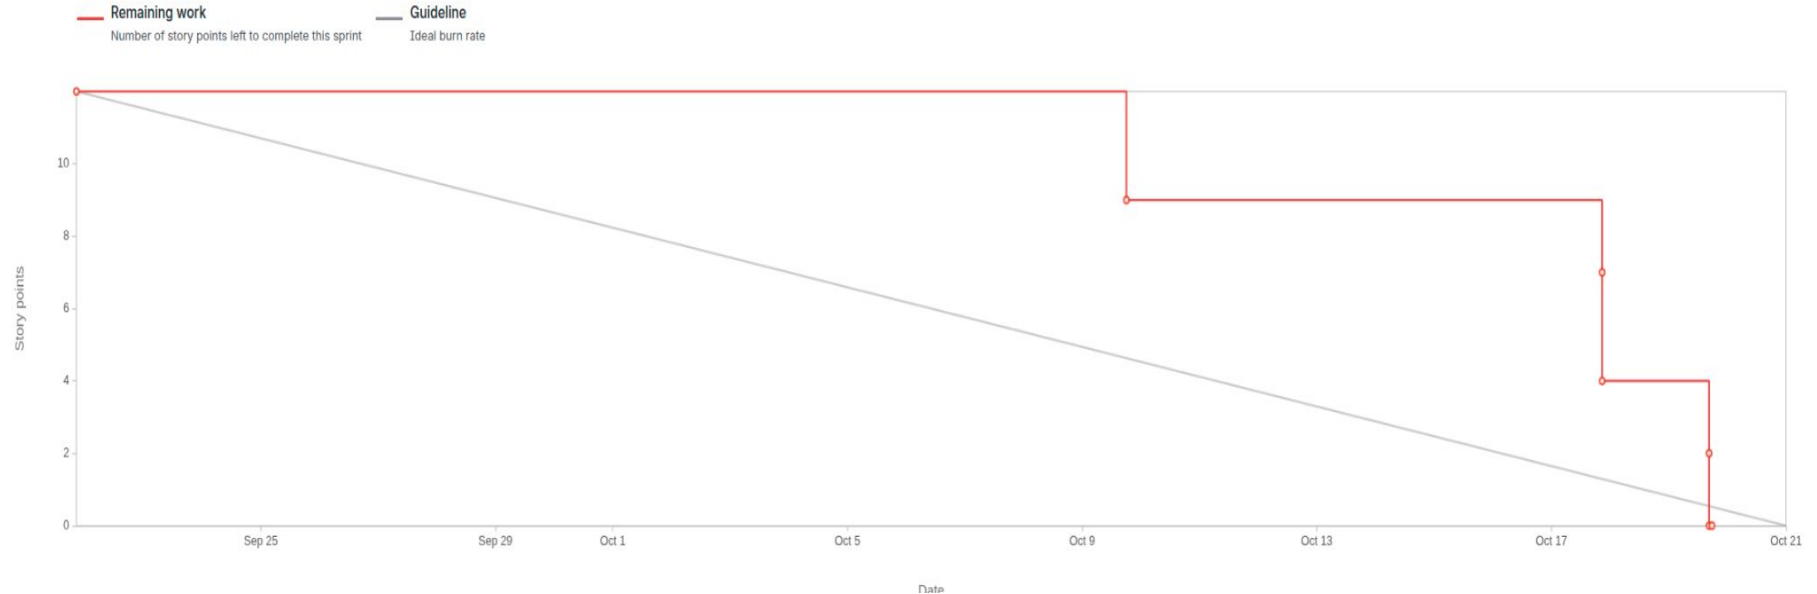

The screenshot shows a Jira sprint backlog for the sprint 'Refining Frontend / Middleware' running from 19 Oct to 16 Nov. The sprint contains 6 work items. Each item is a story, marked as 'DONE', with a category, a status, a story point estimate, and an assignee.

Historical and Average Velocity

User Stories / Test Cases

User Story	No.	Test Case Title	Test Flow Steps	Expected Result	Actual Result	Execution Status
As a Listener, I want to search by city and genre so I can discover relevant artists.	TC1	Search artists by city and genre	Launch app -> Enter city: New York -> Select genre: Hip-Hop -> Submit search	Artists matching city and genre are displayed		Pass
As a listener, I want to search by city only so I can discover artists in a specific location without filtering by genre	TC2	Search with city only	Launch app -> Enter city: Los Angeles -> Submit search	Artists from selected city are displayed		Pass
As a listener, I want to select an artist so I can view details.	TC3	Open artist details page	Perform search -> Select artist from results	Artist detail page loads successfully		Pass
As a listener, I want to view an artist's discography to explore their music.	TC4	View artist discography	Open artist page -> Scroll to discography section	Discography or no-data message is displayed		Pass
As a system, I want the app to handle errors gracefully.	TC5	Handle no-results search	Enter valid city -> Select rare genre -> Submit search	No results message shown; app remains responsive		Pass
As a listener, I want to access the "About Us" page from the site navigation so I can learn about the project.	TC6	Navigate to About Us from Footer/Header	Launch app -> Scroll to Footer (or open Header nav) -> Click "About Us"	User is routed to about and the About page loads without errors		Pass
As a stakeholder, I want to read a mission statement so I understand why the database/project was created.	TC7	Mission statement displays on About page	Open about -> View the Introduction/Mission section	Mission statement is visible, readable, and matches site styling		Pass
As a stakeholder, I want to see team profiles so I can identify who built the project.	TC8	Team grid displays profile cards	Open about -> Scroll to "Meet the Team" -> Observe team grid	Team members display in a clean grid; each card shows Name, Role		Pass
As a frontend developer, I want the About page to be mobile-friendly so I can view content on any device.	TC9	About page responsive layout	Open about -> Resize browser to mobile width (<600px) OR open on phone -> Scroll team	Team grid collapses to a single column; no horizontal scrolling; text remains legible		Pass
As a frontend developer, I want images/avatars to load with alt text so the page is accessible.	TC10	Team avatars load with proper alt text	Open about -> Inspect team cards -> Confirm image/placeholder loads -> Check alt text	Each profile image/placeholder loads successfully and has appropriate alt text		Pass
As a listener, I want to see the project tech stack so I understand what tools were used.	TC11	Tech stack section displays	Open about -> Scroll to Tech Stack section	Tech stack section renders (icons or text) and matches site aesthetic		Pass
As a Listener, when I have a question, I want to submit a contact form so I can reach the team without leaving the app.	TC12	Contact form fields available	Open contact -> Verify fields	Contact form displays with required fields		Pass
As a backend system, I want artist location (City/Country) displayed so I can understand where the artist is from.	TC13	Artist blurb shows City and Country	Search -> Select an artist with known city/country -> Open artist info section/blurb	Artist info shows City and Country labels with correct values		Pass
As a system, I want missing location data handled gracefully so the UI stays clean and usable.	TC14	Missing City/Country shows N/A	Search -> Select an artist missing City or Country -> View artist blurb	API returns null/empty for missing fields; UI displays n/a without layout breaking		Pass
As a middleware developer, I want to validate connectivity/auth to the new data host so requests don't degrade.	TC15	Connectivity test passes for new endpoint	Configure new endpoint + auth -> Run connectivity check	Automated connectivity test passes; middleware can reach + authenticate		Pass
As a Artist user, I want a Register Artist page so I can add new artists into the database.	TC16	Register Artist page loads with required field	Open app -> Navigate to Register Artist page -> Inspect form	Form renders and includes Artist Name (required) + Genre + City + Country fields		Pass
As a Artist user, I want successful registration confirmation so I know the artist was created.	TC17	Successful artist registration returns and confirm	Open Register Artist -> Enter valid Name/Genre/City/Country -> Submit	Frontend shows success message; API returns 201 Created; artist is stored		Pass
As a Listener, I want newly registered artists to appear in discovery so data changes are visible.	TC18	Newly registered artist appears in search results	Register a new artist -> Navigate to search -> Search by that artist's City/Genre	New artist is returned in results and is selectable		Pass
As a Listener, I want the new artist to have a working details page so records are usable.	TC19	Newly registered artist opens in artist detail view	After registering -> Click the artist from results/list -> Open artist details	Artist detail loads; fields match what was submitted		Pass
As an SRE/developer, I want inter-service networking so middleware can reach the database privately.	TC20	Middleware can connect to database	Bring stack up -> Verify middleware attempts DB connection -> Confirm hostname works	Middleware connects using internal network; DB not exposed publicly		Pass

User Stories / Test Cases

ID	Epic	User Story	Goals	Acceptance Criteria	Test Cases	Points	Sprint
Configure Data Storage	API Data Integration	As a middleware, When I receive a request, I want to be able to access the data that is stored in a cloud service.	Should be easily accessible Data should hold its integrity and structure Data should be hosted in a cloud service	Must be reachable by API key or token Data must have same JSON structure Data should be hosted on an accessible	Happy Path: Middleware successfully retrieves and validates cloud data structure Given the cloud data service is reachable via its endpoint And the Middleware has a valid authentication token/key When the Middleware makes a request to the cloud service Then the response status code should be 200 (OK) And the retrieved data should adhere to the predefined JSON schema And the retrieved data should contain the expected primary fields Sad Path: Middleware fails to access data with invalid credentials Given the cloud data service is reachable via its endpoint And the Middleware attempts to access the service with an invalid or expired token/key When the Middleware makes a request to the cloud service Then the response status code should be 401 (Unauthorized) or 403 (Forbidden) And the Middleware should log the access failure securely And the Middleware should return an appropriate error message to the calling client	3	2
Create Containerization Files for Cloud Host	Application Hosting	As a developer When I want to run the full application I want to be able to do so by running the application and its components	The application is able to be hosted within docker The README is updated to support initialization with both docker The application should be able to be run without any dependencies	Developers can Run the application by following the README Interact with the application without any dependencies	Happy Path: Developer successfully starts the entire application stack using Docker Compose Given the developer has Docker installed on their machine And the developer has pulled the latest repository code When the developer executes the documented "docker-compose up" command Then all required application services (e.g., middleware, database) should start successfully And the developer should see logs indicating all services are "healthy" or "running" And the application should be reachable via the documented local host port	1	2
Comprehensive Middleware Testing	Web Application	As a developer When I run the test for the middleware application I want to be shown all test cases for the middleware including happy and sad paths	All endpoints of the middleware should be assigned a proper API endpoint All test should validate data functionality and test case (happy/sad path) The application should be able to be run without any dependencies	Developers can Run pyunit test for middleware, where all test cases are covered Can quickly understand the happy/sad paths	Happy Path: Middleware Test Suite successfully runs Happy Path tests Given the test environment is correctly configured (API keys valid, external services available) And the test runner executes all tests for the "search" endpoint When the test case named "test_search_returns_multiple_artists_200" is run Then the test should assert that the response status code is 200 (OK) And the test should assert the response body contains a valid JSON list of artists And the test result should be "PASS" (green) Sad Path: Middleware Test Suite validates Sad Path for Invalid Request Given the test runner executes all tests for the "artist[id]" endpoint When the test case named "test_get_artist_invalid_id_returns_400" is run with a non-integer or malformed Then the test should assert that the response status code is 400 (Bad Request) And the test should assert that the error message clearly states the input validation failure And the test result should be "PASS" (green)	2	2

Project Schedule

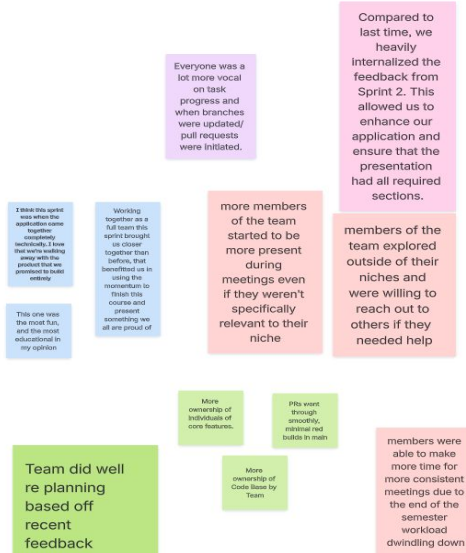

Work		SEP	OCT	NOV	DEC
Sprints			Minimum Viable Product	Refining Frontend / Middleware	Application Hosting
☐ > CFYBY-1 Music Web App Proposal					
☐ > CFYBY-2 API Data Integration					
☐ > CFYBY-26 Containerization and Additiona...					

- Sprint 0 : September 2 - September 22
- Sprint 1 : September 23 - October 20
- Sprint 2 : October 21 - November 17
- Sprint 3 : Completion of MVP: November 18 - December 15

Weekly Meetings: Tuesdays at 6:00PM

Retrospective

✓ Good

✗ Bad / could be better

🔧 Actions

AI Disclosure

These AI Tools were used to aid us in brainstorming and project development:

- Gemini CLI
 - Used for generating boilerplate code for frontend webpages and debugging.
- ChatGPT
 - Used for brainstorming and debugging.

Thank You!
